(7) 5/31/79

Dear Bob,

Enclosed are funds to cover cost of a copy of the Hacker's manual. I also need source/object code listings - mnemonic programs etc. for Bally's roms if the become available. I am especially looking for their resident monitor or executive routine.

I am presently working on an S-100 interface board to allow expansion and hope to have one up and running by end of June. The memory dump programs work fine until you reach an address with a decimal contents ~~exact~~ greater than 32767. I found one at 2696.

You might also note that the card edge connector is .1" spacing and therefor will mate with "APPLE" 25/50 connectors and

cable. I am hoping that the resident contrl software (for start-up and ~~video~~ video/IO functions) is located in the lower 2K of ROM. If so the $\overline{CS}$ to the other three ROM's can be switch disabled and a decent extended BASIC can be located in the additional 14K before the screen memory area. Additional RAM can be Buss connected by addressing it after 24576 but T-Basic ~~can't~~ (may not be able to) utilize any address above 32767.

Sincerely

Scott Galbraith
